

Basic instructions to run a python code

1. Log in. See Registration instructions if this is your first time.
2. Once logged in, send your code to the node:

nano <code>.py

Normally you will run test cases on your own hardware on a python file. You will just copy paste your code on this file.

3. Now you need to create the job script for what cluster to use and how many nodes, etc

nano job_script.sh

Be sure to select correct nodes for GPU usage/No GPU. For more info see these links:

<https://utc.teamdynamix.com/TDClient/2717/Portal/KB/ArticleDet?ID=163829>

<https://utc.teamdynamix.com/TDClient/2717/Portal/KB/ArticleDet?ID=163830>

Also the file job_script.txt contains the template for this script file

4. Now send the job:

5. sbatch job_script.sh

6. You should now have an output.txt (or whatever you named it) file after the job is done. Run this via:

7. nano output.txt

8. Congrats! You did it. To log out just type "exit"

For codes that save a plot, it is a little involved to view it. It involves having a terminal window open for the HPC and one open for you local computer.

1. Find the path of where the file is located on the HPC:

[whm543r@epyc ~]# find ~ -name "simple_plot.png"

/home/whm543r/simple_plot.png

2. Now we use the local computer terminal and run:

scp whm543r@epyc.simcenter.utc.edu:/home/whm543r/simple_plot.png ~/Downloads/

3. Now the file should be in your downloads folder.
